Mathematical Subject Classification (2010). — 05C80, 60G50.

Keywords. — Random graphs, random walks, continuous time embedding.

Mots-clefs. — Graphes aléatoires, marches aléatoires, plongement en temps continu.

A RANDOM WALK AMONG RANDOM GRAPHS

Nicolas Curien

Abstract. — Random graphs now stand at the forefront of modern probability and statistics, serving as powerful tools for modeling complex systems across disciplines. This course, tailored for Master's and PhD students, offers a rigorous and insightful introduction to the foundational models of random graph theory—among them the Bienaymé-Galton-Watson trees, the Erdős-Rényi graph, and preferential attachment models such as the Barabási-Albert graph. We present short and modern proofs of landmark results, including the emergence of a giant component in Erdős-Rényi graphs and the asymptotic behavior of distances and degree distributions in preferential attachment networks. Special emphasis is placed on the core probabilistic techniques that drive these analyses—such as the method of moments, random walk theory, and Poissonization—equipping students with versatile tools that apply far beyond the scope of this course.

Résumé (Une promenade parmi des graphes aléatoires). — Les graphes aléatoires occupent une place centrale en probabilité et en statistique. Ce sont de puissants outils pour modéliser des systèmes complexes dans de nombreux domaines. Ce cours, conçu pour des étudiants de master et de doctorat, propose une introduction aux modèles fondamentaux de la théorie des graphes aléatoires – parmi lesquels les arbres de Bienaymé-Galton-Watson, le graphe d'Erdős-Rényi, ainsi que les modèles à attachement préférentiel, tels que le graphe de Barabási-Albert. Nous présentons des démonstrations modernes et concises de résultats majeurs, comme l'émergence d'une composante géante dans le graphe d'Erdős-Rényi, ou encore le comportement asymptotique des degrés et des distances dans les graphes à attachement préférentiel. Une attention particulière est portée aux outils probabilistes fondamentaux qui sous-tendent ces résultats – notamment la méthode des moments, la théorie des marches aléatoires et la poissonnisation – dotant ainsi les étudiants d'un ensemble de techniques puissantes, applicables bien au-delà du champ de ce cours.

CONTENTS

A random walk among random graphs	1
Notation	3
1. Basics of percolation	5
1.1. Basics on graphs	5
1.2. Percolation	8
1.3. Phase transition	8
1.4. Two examples	9
1.4.1. Regular d -ary tree	10
1.4.2. Cubic lattice $\mathbb{Z}^2$	12
1.5. Mean-field regime	13
Part I. Bienaymé-Galton-Watson trees	15
2. One-dimensional random walks	17
2.1. General theory	18
2.1.1. Reminder on Markov chains	18
2.1.2. 0–1 laws	19
2.1.3. Asymptotic behavior	20
2.2. Walks with finite mean and the law of large numbers	21
2.2.1. Recurrence/transience	21
2.2.2. Wald’s equality	22
2.3. Heavy tailed random walks	25
2.4. Fourier transform	27
2.4.1. Chung-Fuchs	28
2.4.2. Local central limit theorem	29
3. Skip-free random walks	33
3.1. Duality lemma	33
3.1.1. Duality	33
3.1.2. A proof of the law of large numbers	35
3.2. Cycle lemma	36
3.2.1. Kemperman’s formula	37
3.3. Ballot theorems	41

3.3.1. Ballot theorem	41
3.3.2. Staying positive forever	42
3.3.3. Parking on the line	43
3.4. Wiener-Hopf factorization	45
3.4.1. Ladder variables	45
3.4.2. Wiener-Hopf factorization	46
4. Bienaymé-Galton-Watson trees	51
4.1. Plane trees and Bienaymé-Galton-Watson processes	52
4.1.1. Plane trees	52
4.1.2. Bienaymé-Galton-Watson trees	53
4.2. Łukasiewicz walk and direct applications	54
4.2.1. Łukasiewicz walk	54
4.2.2. Łukasiewicz walk of a Bienaymé-Galton-Watson tree	56
4.2.3. Lagrange inversion formula	60
4.3. Probabilistic counting of trees	62
4.3.1. Prescribed degrees	62
4.3.2. Uniform geometric BGW plane trees	63
4.3.3. Cayley and Poisson BGW trees	65
4.3.4. Contour function	68
4.4. The Brownian continuum random tree	70
4.4.1. Gromov-Hausdorff topology	70
4.4.2. Brownian excursion as a continuous contour function	71
Part II. Erdős-Rényi random graph	75
5. Local properties	77
5.1. Connectivity	79
5.1.1. Isolated vertices	79
5.1.2. Hitting time theorem	80
5.2. Other thresholds via first and second moments	83
5.2.1. Diameter	83
5.2.2. Ramsey theory, max-clique, $P = NP$ and alien invasion	84
5.3. Higher moments	87
5.3.1. The Poisson paradigm	87
5.3.2. Spectrum	89
6. Birth of a giant 1, via ε-cut	95
6.1. The local limit	97
6.2. An easy giant via ε -cut	99
6.3. Sprinkling	100
7. Birth of a giant 2, exploration and fluid limit	103
7.1. Exploration process as a Markov chain	103

7.2. Differential equation method or fluid limit	105
7.2.1. Stochastic Gronwall lemma	108
7.3. Corollaries and refined estimates	110
7.3.1. Subcritical case	111
7.3.2. Critical case	111
7.3.3. Supercritical case	112
8. Birth of giant 3, Poissonized	115
8.1. The stacked model and its exploration	116
8.2. Law of the increments	118
8.2.1. Fixed size	118
8.2.2. Poissonized version	119
8.3. Phase transition for the giant	120
8.3.1. Existence of the giant component	120
8.3.2. Critical case	121
8.4. Connectedness	122
Part III. Random tree growth	125
9. Random permutations	127
9.1. Feller coupling	127
9.1.1. Foata correspondence	127
9.1.2. Feller coupling	128
9.2. Large cycles and Poisson-Dirichlet distribution	130
9.2.1. Stick breaking construction	130
9.2.2. Dickman function and prisoners	132
9.3. Poisson count for short cycles	135
9.3.1. An abstract limit from the Feller coupling	135
9.3.2. Cauchy's formula and interpretation	136
9.3.3. Poisson limit	137
10. Random recursive tree	141
10.1. Chinese Restaurant process	142
10.1.1. Coupling CRP-RRT	142
10.1.2. Pólya urn and almost sure convergence towards Poisson-Dirichlet ..	143
10.2. Degrees	146
10.2.1. Degree of fixed vertices	146
10.2.2. Empirical degree distribution	147
10.2.3. Maximal degree	147
10.3. Height	148
10.3.1. Typical height	148
10.3.2. Maximal height	149

11. Continuous-time branching processes	151
11.1. Continuous-time branching trees	151
11.1.1. Properties of exponential laws	151
11.1.2. Continuous branching trees and their associated Markov chains	153
11.2. Yule trees	155
11.2.1. $k = 1$ and Poisson process	155
11.2.2. $k \geq 2$ and Yule trees	156
11.3. Examples	159
11.3.1. Pólya Urn, reloaded	159
11.3.2. Depoissonization tools	159
11.3.3. Coupon collector	161
11.3.4. Balls in bins	162
11.3.5. Pill problem	163
11.3.6. O.K. Corral	164
11.4. Back to the Random Recursive Tree	166
11.4.1. Construction of the RRT from a Yule process	166
11.4.2. Degree statistics	166
11.4.3. A new look at Goncharov & Kolchin's result	167
11.4.4. Concentration of local statistics	168
12. Spine decomposition and applications	171
12.1. Spine decomposition of Yule trees	171
12.1.1. Martingale transform	171
12.1.2. Spine decomposition	173
12.2. Application to extreme geometric properties of the RRT	175
12.2.1. Maximal Height in RRT	175
12.2.2. Maximal degree in RRT	176
13. Barabási-Albert preferential attachment tree	179
13.1. Equivalent constructions	179
13.1.1. Plane recursive tree	180
13.1.2. Construction via Yule tree of order 3	181
13.2. Degrees	182
13.2.1. Almost sure convergence	183
13.2.2. Maximal degree	184
13.2.3. Empirical degree distribution	186
13.3. Height	187

Large deviations for Poisson random variables	189
Bibliography	191

A RANDOM WALK AMONG RANDOM GRAPHS

The theory of random graphs is now ubiquitous in probability theory, and there are already many comprehensive textbooks (to name just a few [113, 114, 23, 69, 46, 49]) dealing with the numerous models of random graphs invented over the last decades. The goal of these lecture notes is to give a glimpse of a few models of random graphs together with some of the probabilistic tools used to study them. It is intended for master or PhD students in probability theory. I chose the models of random graphs mainly by taste and by the will to cover different types of probabilistic arguments. This document should not be seen as an authoritative reference but rather as a recreational (random) walk in the wonderland of random graph theory. Several exercises of varying difficulty (most of them being non trivial) are scattered along the text and each chapter is ended with bibliographical pointers. Here are the main topics covered in these lecture notes together with the *mathematical tools they introduce*:

- CHAPTER I: Basic of (bond) percolation. Phase transition. The Rado graph.
Graph theory, first and second moment, duality.
- CHAPTER II: One-dimensional random walk, Recurrence/transience, Oscillation/drift.
Law of large numbers and its reciprocal, Fourier transform.
- CHAPTER III: Skip-free random walk, duality and cycle lemma. Applications: Kemperman formula, Ballot theorem, parking on the line.
Feller combinatorial cyclic lemma.
- CHAPTER IV: Bienaymé-Galton-Watson trees, Łukasiewicz encoding, Enumeration.
Formal series, Neveu's plane tree formalism.
- CHAPTER V: Sharp threshold for graph properties on the Erdős-Rényi: connectedness, clique number, diameter, cycle. Convergence of the spectrum.
First and second moment method, method of moments, Poisson paradigm.
- CHAPTER VI: Phase transition for the giant component I.
 ε -cut, first moment method, sprinkling, multiplicative coalescent.
- CHAPTER VII: Phase transition for the giant component II.
Markovian exploration, differential equation method.
- CHAPTER VIII: Phase transition for the giant component III.
Poissonization, bin counting processes, Brownian asymptotics.

- CHAPTER IX: (Uniform) random permutations. Poisson-Dirichlet distribution and Dyckman function for large cycles. Poisson limit for small cycle counts.
Feller's coupling, randomization, stick breaking construction.
- CHAPTER X: Random recursive tree (and random permutations).
Chinese restaurant process, recursive distributional equation, Pólya urn scheme.
- CHAPTER XI: Continuous-time embedding and applications.
Athreya-Karling embedding of Markov chains, convergence of Yule processes and links between exponential and Poisson processes.
- CHAPTER XII: Spine decomposition and applications.
Martingale transform, spine decomposition, many-to-one formulas.
- CHAPTER XIII: Barabási-Albert random tree.
Preferential attachment mechanism, scale-free random networks.

Many thanks go to the students that attended the “random graph” master course I gave in 2019-2025 at Orsay. They contributed to the development of the material and spotted many typos. I am particularly grateful to Alice Contat, Baojun Wu (promotion 2019), Guillaume Blanc, Maude Bellugeon, Elie Khalfallah (promotion 2020), Tanguy Lions, Francisco Calvillo (promotion 2021), Corentin Correia, Loïc Gassmann (promotion 2022), Nathan de Montgolfier, Laureline Legros, Emile Averous (promotion 2023), Remi Bernard, Simone Maria Giancola (promotion 2024). Special thanks go to Damian Cid for spotting (so) many typos and inaccuracies and for his participation to Chapter 8. I am also grateful to Serte Donderwinkel for many useful comments. Do not hesitate to reach me if you have any (constructive) comment!
